

Many debts. One position.

Real people owe each other across **dozens of bills**. Splitsy's dashboard collapses that into **one net figure per counterparty**.

	Owed to me	I owe	Net
@dev	\$0	\$43.75	-\$43.75
@carla	\$18.40	\$0	+\$18.40
sam@example.com	\$7.00	\$0	+\$7.00

Sorted by largest exposure first. Labels resolve to handles, not raw hex.

x402 nanopayments on Arc

Splitsy's `/api/ocr` and `/api/fx` are **x402 sellers**:

Endpoint	Price	What it does
<code>/api/ocr</code>	\$0.005	Parse a receipt
<code>/api/fx</code>	\$0.001	Convert a foreign currency

The flow per call:

1. Scout `POST` s → seller returns **402 Payment Required** (`PAYMENT-REQUIRED` challenge).
2. Scout signs a **gasless EIP-3009 authorization** — sends no transaction, pays zero gas.
3. Facilitator `verify()` → `settle()`; **Circle Gateway batches** it on Arc.
4. `200 OK` + `PAYMENT-RESPONSE` with the tx hash. Ledgered as **earned**.

A live agent economy — one scan

3 nanopayments · \$0.011 spent

A single shaky, EUR receipt drives:

- `/api/ocr` **\$0.005** — first parse, confidence 0.62 ⚠️
- `/api/ocr` **\$0.005** — second opinion `{ hq: true }`, confidence 0.94 ✅
- `/api/fx` **\$0.001** — EUR ≠ USD

The dashboard's **Agent Economy panel** shows earned vs. spent, calls served vs. paid, and **budget remaining** — updating live as Scout works.
